

My website form is supposed to be taking patient information, checking its authenticity via a review button while utilizing a submit and reset button as well as a validate button- while also checking that information being submitted to certain boxes is valid. I had an immense amount of problems with the validate button- hence why the project is slightly late- I think i accidentally ended up modifying my onedrive files as well and turned my original submitted project 2 into my project 3 while trying to duplicate my project so i could speed up my trouble shooting- I was unable to format my validate output into the center of the screen regardless of what I tried- even watching the TP misso video didnt help, I blocked out my CSS code so it still remains, but all that it would do is cause nothing to appear when i click validate, I also had trouble with validating everything after last name on my sheet, but fixed it with some syntax revisions
